INTRODUCTION

Integrated List of Waters

This report presents the 2002 Integrated List of Waters for Massachusetts. A companion document (Part 1) entitled *Massachusetts Year 2002 Integrated List of Waters - Context and Rationale for Assessing and Reporting the Quality of Massachusetts Surface Waters* presents a brief history of water quality management in Massachusetts and presents the methodology that is currently employed for assessing the status of Massachusetts' waters and reporting on them in individual watershed reports.

The objective of the Federal Clean Water Act (CWA) is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters. To meet this goal the CWA requires states to develop information on the quality of their water resources and report this information to the U.S. Environmental Protection Agency (EPA), the U.S. Congress, and the public. To this end, the EPA released guidance on November 19, 2001 for the preparation of an *Integrated List of Waters* that would combine reporting elements of both § 305(b) and § 303(d) of the CWA. The integrated list format allows states to provide the status of all their assessed waters in a single multi-part list. States choosing this option list each water body or segment thereof in one of the following five categories:

- 1) Unimpaired and not threatened for all designated uses;
- 2) Unimpaired for some uses and not assessed for others;
- 3) Insufficient information to make assessments for any uses;
- 4) Impaired or threatened for one or more uses but not requiring the calculation of a Total Maximum Daily Load (TMDL); and
- 5) Impaired or threatened for one or more uses and requiring a TMDL.

Thus, waters listed in Category 5 constitute the 303(d) List and, as such, are reviewed and approved by the EPA. The remaining four categories are submitted in fulfillment of the requirements under § 305(b), essentially replacing the old 305(b) Report format.

In order to give states enough time to adjust to the new format, the due date of the Integrated List of Waters was changed to October 1 rather than April 1, 2002. The EPA acknowledged that not all states are in a position to submit an integrated list for 2002. Therefore, states are also provided the option of submitting separate 305(b) and 303(d) documents as in previous years. Moreover, the EPA guidance allows states to work toward the goal of developing an integrated list of waters even if all features of the new format called for in the guidance are not provided in the 2002 submittal.

Massachusetts' proposal to progress toward an integrated list of waters for 2002 was outlined in a letter dated February 14, 2002 from the Division of Watershed Management (DWM) Director Glenn Haas to Dave Webster of the EPA. The letter stated that a five-category list would be produced in accordance with the new guidance, but that several other provisions of the guidance would not be implemented for 2002. For example, while the EPA will ultimately require that states adopt a new Assessment Data Base (ADB) for storing assessment information, Massachusetts is relying on the information stored in the Water Body System (WBS) for one more reporting cycle with the goal of converting to the use of the ADB for reporting in 2004.

The new EPA guidelines also specify that each state submit a comprehensive assessment and listing methodology and detailed monitoring strategy as part of the integrated list package. Although the Consolidated Assessment and Listing Methodology (CALM) was published by the EPA in its final form in September 2002, it was not available in time for states to use it in developing the 2002 integrated list. For this reporting cycle, Part 1 of the 2002 Integrated List Report and the individual watershed assessment reports prepared by the DWM provide the

rationale and supporting information pertaining to how the assessments were made and what monitoring is needed in the future to fill data gaps.

Finally, the new EPA guidance for the development of Category 5 of the integrated list is consistent with past requirements of § 303(d) in that a TMDL schedule is called for that reflects the priority ranking of each water segment/pollutant combination. Nonetheless, the priority ranking and TMDL schedule for individual waters is not included as a part of the 2002 Integrated List of Waters. This is discussed in more detail at the end of this Introduction.

The 2002 integrated list does not represent an entirely new statewide assessment. For purposes of reporting under the CWA, Massachusetts provides new assessment information only for those watersheds that have completed the monitoring and assessment phases since the submittal of the previous 305(b) Report or 303(d) List. A 303(d) List of Impaired Waters was last submitted and approved by the EPA in 1998; however, a 305(b) Summary of Water Quality Report was published in 2000. Since watershed assessments are continuously carried out according to the Massachusetts watershed management cycle these two most recent CWA reporting elements include slightly different sets of updated assessments. In any event, the 2002 Integrated List represents ten new watershed assessments – Blackstone, Boston Harbor, Cape Cod, Chicopee, Connecticut, French & Quinebaug, Merrimack, Narragansett/Mount Hope Bay and Nashua and Parker – completed since the 2000 305(b) Report was published plus an additional five updated watershed assessments - the Charles, Housatonic, Hudson, North Coastal and Ten Mile – that were not reflected in the 1998 303(d) List.

Integrated list categories 1-3 include those waters that are either unimpaired or unassessed with respect to their support of designated uses. Often insufficient data and information exist to assess all designated uses of any particular waterbody or segment. Furthermore, no Massachusetts waters are listed in Category 1 because a state-wide health advisory pertaining to the consumption of fish precludes any waters from being in full support of the fish consumption use. Waters listed in Category 2 were found to support the uses for which they were assessed, but other uses were unassessed. Finally, Category 3 contains those waters for which insufficient or no information was available to assess any uses. Waters for which assessments were determined to be insufficient for 303(d) listing were also included in Category 3.

Waters exhibiting impairment for one or more uses are placed in either Category 4 (impaired but not requiring TMDLs) or Category 5 (impaired and requiring one or more TMDLs) according to the EPA guidance. Category 4 is further divided into three sub-categories – 4A, 4B and 4C – depending upon the reason that TMDLs are not needed. Category 4A includes waters for which the required TMDL(s) have already been completed and approved by the EPA. However, since segments can only appear in one category, waters that have an approved TMDL for some pollutants but not others remain in Category 5 until TMDLs are approved for all of the pollutants. A list of all of the TMDL documents approved by the EPA is provided in Table 1. Reference is made in list categories 4A and 5 to the applicable TMDL documents.

Category 4B lists waters for which other pollution control requirements are reasonably expected to result in the attainment of the designated use before the next listing cycle (i.e., 2004). Because of the uncertainty related to making predictions about conditions in the future the MADEP made a decision not to utilize Category 4B in the 2002 Integrated List. Finally, waters impaired by factors such as flow modification or habitat alteration that are not subjected to TMDL calculations because the impairment is not related to one or more pollutants were included in Category 4C. These non-pollutant stressors are also presented in parentheses in Category 5 to distinguish them from pollutants requiring TMDLs.

While the EPA's guidance for the preparation of the *Integrated List of Waters* provides the overall framework for a five-part list of waters, the development, submittal, and review of Category 5 remains subject to the prevailing regulation governing the implementation of § 303(d) of the CWA. This regulation requires states to identify and list those waterbodies that are not expected to meet

surface water quality standards after the implementation of technology-based controls and, as such, require the development of TMDLs. States must include on the lists the specific pollutant(s) or stressor(s) causing the impairment (if known). Finally, guidance pertaining to § 303(d) is clear with respect to the removal of waterbodies from the list. Waterbodies or applicable segments thereof can be removed when a TMDL is approved by the EPA for that waterbody or segment (note that these waters are now listed in Category 4A). In addition, there are some instances when a previously listed waterbody can be removed from the 303(d) List without calculating a TMDL. These are: 1) when a new assessment reveals that the waterbody is now meeting all applicable water quality standards or is expected to meet those standards in a reasonable timeframe as the result of implementation of required pollution controls (Category 4B), and 2) when, upon re-examination, the original basis for listing is determined to be flawed.

The development of the 2002 Category 5 list began with a review of the 1998 303(d) List as well as the fifteen watershed assessment reports completed since the 1998 list was published. In preparing 303(d) lists states are required to assemble and evaluate all existing and readily available data, including but not limited to the most recent 305(b) report and 319 nonpoint source assessment report, dilution calculations or predictive simulation models, and reports by government agencies, members of the public, or academic institutions. When preparing individual watershed assessment reports DWM relies on these and additional information sources as described in "Information Sources" in Part 1 of this document. In turn, these reports provide the documentation for the assignment of each waterbody to the appropriate Integrated List category. Waters listed on the 1998 303(d) List, for which no new assessment has been made, are retained in Category 5 of the 2002 Integrated List.

The CWA distinguishes between "pollutants" such as nutrients, metals, pesticides solids and pathogens that all require TMDLs and "pollution" such as flow alterations, habitat alterations or non-native species infestations that do not require TMDLs. Waters were listed in Category 5 if they were identified as impaired (i.e., not fully supporting one or more intended use), the impairment was related to the presence of one or more "pollutants", and the source of those pollutants was not considered to be natural. In most instances finding an impaired waterbody in the watershed assessment report led directly to its inclusion in Category 5. However, some differences do exist between the assessment reports and the 303d list. For example, segments for which incomplete or anecdotal information suggests the possibility of use impairment are assigned "alert status" in the watershed assessment reports so that they may be targeted for monitoring and follow-up assessments during the next round of the basin cycle. However, these segments are not listed as impaired on the 303(d) list because the DWM believes there is insufficient data to support listing decisions.

Furthermore, waterbodies exhibiting potential aquatic life use-impairment as the result of their falling into the "moderately impaired" category based on a preliminary benthic macroinvertebrate community analysis (Rapid Biomonitoring Protocol II) are not listed in Category 5 until the impairment can be confirmed using a more definitive methodology (i.e., RBP III). RBP II analyses are used as a screening mechanism for assessing aquatic life use-support. Nonetheless, determinations of no impairment or severe impairment with RBP II can be considered definitive and waters in the latter category are included on the 303(d) List. However, RBP II assessments of many waterbodies fall between these extremes into the "moderately impaired" category that extends over a wide range of water quality and habitat conditions. With the finer level of resolution offered by the RBP III, some of these same waterbodies exhibit much less impairment than indicated initially by the RBP II. For this reason, the MADEP has established the RBP III analysis as a minimum requirement for purposes of listing waters in Category 5 unless the RBP II assessment is definitive as discussed above.

Fish Consumption Advisories

In 1994, the Massachusetts Department of Public Health (DPH) issued a statewide advisory on mercury in freshwater fish. While several advisories for individual waterbodies had addressed larger populations of consumers (e.g., nursing mothers, children under 12, etc.) this statewide precautionary measure was aimed at pregnant women only, and the general public was not considered to be at risk from consuming fish from any waterbodies unaffected by site-specific DPH advisories. Nonetheless, since the statewide advisory encompasses all freshwaters, these waters cannot be considered as "fully supporting" the fish consumption use and, therefore, all freshwaters in Massachusetts are listed as 303(d) waters with mercury as the associated pollutant/stressor. All waters that are subject to site-specific DPH mercury advisories are listed in Category 5, because these advisories are based on actual risk assessments using data collected from those waterbodies. A list of all DPH site-specific fish consumption advisories currently in force is appended to Part 1 of this report. It is important to note that, while unacceptable mercury levels found in edible fish tissue constitute an impairment of the fish consumption use, other uses are unaffected by these advisories and are assessed according to the methodologies presented in Part 1 of this document.

Waters covered by the statewide advisory, as well as site-specific advisories, may be impacted by unconfirmed local sources or by atmospheric deposition from near- and far-field sources. While Massachusetts will continue to identify and control local sources of mercury through existing air quality and waste-site clean-up programs, TMDLs may be useful both for determining necessary mercury source reductions and for providing technical support for adopting a national mercury reduction strategy. However, in the case of mercury contamination from atmospheric deposition, the MADEP will initially place a lower priority on TMDLs for individual waterbodies in anticipation of further guidance from the EPA on this technically difficult issue.

Predictive Models

The EPA guidelines require that waters must be included on the 303(d) list if dilution calculations or predictive simulation models forecast non-attainment of water quality standards. During the 1970s and 1980s MADEP used steady-state low-flow stream models to calculate waste load allocations (WLA) for point discharges. Aimed primarily at reducing instream biochemical oxygen demand (BOD) and ammonia loads, the WLA were adopted in 303(e) basin plans and incorporated in individual NPDES wastewater discharge permits. As a result, advanced secondary or advanced waste treatment were implemented where necessary across Massachusetts and only occasional reviews are now needed to assess the adequacy of existing treatment in light of anticipated increases in wastewater flows. Because of the complex and site-specific nature of remaining water quality problems (e.g., nutrients, toxicants, etc.) predictive models have limited value in identifying impaired waters. In fact most modeling is now carried out for waters where impairments have already been confirmed by actual water quality or biomonitoring data. Nonetheless, predictive models continue to be utilized in combination with actual field data to fully assess water quality conditions and to derive acceptable pollutant loadings from point and nonpoint sources. Model results are considered in the 303(d) listing process in cases where those models forecast unconfirmed water quality problems. Two examples of cases where dilution calculations play a role in assessment and listing decisions are where whole effluent toxicity test results are used to predict potential instream impairments, and where waters subjected to combined sewer overflows (CSO) are projected to violate standards even though confirmatory field data may be unavailable.

Noxious Aquatic Plants

As previously indicated, the EPA guidelines allow for waters to be removed from the 303(d) list in cases where it has been determined that the original assessment and listing decision was inaccurate or incomplete. When preparing the list of Category 5 waters for 2002, the MADEP made such a determination with regard to many lakes and ponds that had been historically listed as being impaired by "noxious aquatic plants". Many of these lakes, while exhibiting macrophyte growth to some degree, were listed as the result of visual reconnaissance aimed primarily at

assessing recreational uses. As a result, even relatively light plant infestations – sometimes as low as 10% areal coverage - were considered potentially unsuitable for swimming and boating and were recorded in the state assessment database as less than fully supporting the use. These preliminary determinations were made without regard to whether, despite dense plant coverage in some locations, other areas of the lake sufficiently supported boating and swimming uses. When the first 303(d) List was formulated in 1992 large numbers of lakes were automatically listed as impaired without determining: 1) how much data and information were actually available for making the initial assessment; 2) whether or not the extent of macrophyte growth observed was an indicator of natural conditions; or 3) if the waterbody as a whole supported recreational uses.

Earlier assessments did not necessarily take into account the natural morphology of the lakes that may have provided ideal habitat for the proliferation of aquatic macrophytes. In such instances the dense coverage of plants may have been due to natural conditions and these lakes should not have been considered impaired. Moreover, no attempt was made at the time of these assessments to perform reconnaissance throughout the lake drainage basins in an effort to determine whether or not the plant growth observed in the lakes was accelerated by the input of plant nutrients originating from anthropogenic (i.e., man-made) sources. Whether affected by man's activities or not, erosional processes occurring in lake watersheds lead to sedimentation, nutrient contribution and higher productivity that contribute to a natural succession from aquatic to terrestrial ecosystems. While the rate of this succession may be greatly accelerated by solids and nutrients in wastewater discharges and runoff from altered landscapes, the process occurs naturally over long periods of time. Thus, even in undeveloped watersheds, shallow lakes and wetlands may exhibit dense stands of aquatic and semi-aquatic macrophytes that are indicative of the natural evolution of these systems and, as such, they should not be labeled as impaired for purposes of 303(d) listing.

As alluded to above, not all designated uses were afforded the same level of attention when the assessment of many of the lakes and ponds appearing on previous 303(d) lists was originally carried out. In many cases non-recreational uses, such as the support of aquatic life, were not assessed, nor did the evaluation acknowledge the valuable role that aquatic macrophytes play in providing food for wildlife and habitat for finfish and other aquatic organisms. For example, finfish require some vegetative cover for nesting grounds and protection from predation. While it may be difficult to settle on an ideal value for macrophyte coverage that balances the habitat requirements of aquatic life with the recreational needs of humans, it is clear that several lakes should not have been listed solely on the basis of a limited assessment of one use in isolated portions of those waterbodies.

For the reasons cited above, the MADEP decided to move to Category 3 of the Integrated List those lakes that were historically listed as impaired solely on the basis of macrophyte ("nuisance aquatic plants") coverage and those for which the stressor "color" referred only to the presence of naturally occurring tannins and lignins in the water column. In doing so, the MADEP reviewed every lake assessment in the Waterbody System to verify that the stressor "nuisance aquatic plants" and did not refer to algal mats or plants such as water meal or duckweed that may exhibit blooming conditions in response to excessive nutrient inputs (i.e., pollutants). Lakes and ponds where these conditions were implied remained on the 303(d) List (i.e., Category 5). Massachusetts believes that the remainder of the lakes and ponds are not impaired by pollutant loadings. Therefore, they will be placed in Category 3 until they can be reassessed in accordance with a more comprehensive lake assessment process that is currently under development by the MADEP.

Prioritization

Massachusetts acknowledges that an important aspect of the 303(d) listing process is the prioritization of waters for TMDL development. In 1998 the MADEP formulated a TMDL Strategy that presented the TMDL efforts to be undertaken in the ensuing years. This strategy was made available for public review and comment concurrent with the Draft 1998 303(d) List. Since that

time several TMDLs have been completed and approved by the EPA and these are identified as such in the 2002 Integrated List. A general priority ranking for TMDL development does exist for the 2002 Integrated List of Waters. However, each waterbody remaining on the 303(d) List in 2002 (i.e., Category 5) has not been assigned an individual priority level. Nonetheless, the priorities for TMDL development of the MADEP remain consistent with the original TMDL Strategy and a more detailed prioritization will be provided with the next list. What is more, Massachusetts has already taken several steps toward refining the original TMDL Strategy. The "Massachusetts Total Maximum Daily Load (TMDL) Program Evaluation" was initiated in 2001 by the consulting firm CH2M Hill under contract with the MADEP. The goals of this evaluation were to 1) provide an external assessment of the technical, resource and financial management challenges associated with the EPA's newly proposed TMDL Rule; 2) develop alternative and innovative resource management and funding approaches to provide for the effective implementation of the TMDL program; and 3) develop a state-wide communications plan to build support for TMDL development and implementation. A TMDL steering committee, consisting of representatives of public, private and governmental groups participated in a series of workshops devoted to important topics related to implementation of the TMDL program such as 303(d) listing and de-listing, prioritization of TMDL development, roles and responsibilities of interested parties, communicating and implementing TMDLs, etc. Massachusetts plans to use the input and recommendations generated during this program evaluation process to set priorities for future TMDL activities. However, the evaluation is not yet completed and final recommendations are in development. Some of the committee recommendations were incorporated into the 2002 Integrated List of Waters. For example the decision to re-evaluate lakes 303(d)-listed in the past based solely on the presence of nuisance growths of aquatic macrophytes was the result of input from the committee. The MADEP intends to use the recommendations of the TMDL committee to develop an updated TMDL Strategy over the next several months that will set the priorities for TMDL development in the future. The MADEP will take into account the severity of the impairment and the uses to be made of the waterbodies when developing updated priorities.

In addition to the project described above, the coordinators of the watershed teams managed by the Executive Office of Environmental Affairs (EOEA) were contacted to inform them of the 303(d) listing and TMDL development processes and to solicit their input on prioritizing waters needing TMDLs in their watersheds. This has led to the "targeting" of several waterbodies for TMDL development. As a result, TMDL projects involving close cooperation between the MADEP, watershed teams and local partners are now underway. Examples of this are ongoing TMDL efforts in the Shawsheen, SuAsCo (Assabet), Charles and Nashua river basins. In addition, the MADEP is cooperating with the EPA and the State of Rhode Island on TMDL activities on two shared watersheds, the Palmer and Kickamuit rivers.

Massachusetts Estuaries Project

Of particular note is the initiation of the Massachusetts Estuaries Project (MEP), a major collaborative effort between the MADEP, the School of Marine Science and Technology at the University of Massachusetts, Dartmouth (SMAST) and interested parties to assess 89 embayments in southeastern Massachusetts and, where necessary, develop allowable nitrogen loadings to those embayments. Many of the embayments are not presently listed in Category 5 for being impacted by nutrients (although many are listed for pathogens). The DWM chose not to list all 89 at this time because either insufficient data are presently available for that purpose and/or different methodologies or standards were used by interested groups for assessment purposes. To ensure consistency in making future listing decisions the Massachusetts Estuaries project is developing a standard methodology to be used for all embayments including the 89 embayments to be assessed through the estuaries project as well as additional coastal waters identified by other interested parties. The MADEP will then add new embayments to the integrated list where appropriate as detailed data become available over the next several years.

In September, 2002, immediately before the proposed 2002 Integrated List was due to the EPA, the MEP's Embayment Water Quality Assessment Interim Report covering priority embayments 1

– 20 was published. While there was insufficient time to review this report and incorporate assessments into the proposed Integrated List at that time, the MADEP has since reviewed it and will include assessments of most of these embayments in the final 2002 Integrated List. A brief discussion of the MEP project, the master list of waters under consideration, and waterbodies newly listed in Category 5 can all be found in Appendix 1 of this report.

All of the projects cited above, which constitute a major portion of the TMDL activities scheduled over the next two years, reflect the collective priorities of the MADEP and others who have a vested interest in maintaining or enhancing the quality of Massachusetts' waters.

Public Participation

The MADEP conducted a public participation process in accordance with regulations governing the development and dissemination of § 303(d) lists. This provided the public the opportunity to review and comment on the *Proposed Massachusetts Year 2002 Integrated List of Waters*. The availability of this document was noticed in the October 9, 2002 edition of the Massachusetts Environmental Monitor, was posted along with the proposed list on the MADEP web site, and was provided to the Massachusetts EOEA Watershed Team leaders. Copies of the document were available from the Division of Watershed Management's Watershed Planning Program office in Worcester and could be found at each MADEP Regional Service Center. The public comment period ended on November 12, 2002. The MADEP received two dozen formal comments from other governmental agencies, watershed associations, and concerned citizens. These are presented with responses in a companion document (Part 3) entitled *Massachusetts Year 2002 Integrated List of Waters - Public Comment Responsiveness Document*.

Massachusetts Category 1 Waters “Waters attaining all designated uses”

Massachusetts is currently listing no waters in this category due to the issuance by the Massachusetts Department of Public Health of a state-wide health advisory pertaining to the consumption of finfish. This advisory precludes any waters from being in full support of the fish consumption use. More information pertaining to fish consumption advisories and the assessment of the fish consumption use can be found in Part 1 of this report.

Massachusetts Category 4b Waters

"Waters expected to attain all designated uses in the near future"

The EPA guidance specifies that waters can be placed in this category if they are presently not meeting one or more designated uses but pollution control measures required by local, state, or federal authority are stringent enough to meet any water quality standard applicable to such waters. Guidance is not clear with respect to the time frame in which the uses would need to be attained but has been generally interpreted as meaning by the time the next integrated list is produced. Due to the lack of clarity in the guidance and the uncertainty involved with making predictions on what future water quality conditions will be Massachusetts is currently listing no waters in this category.

The Massachusetts Estuaries Project

The Massachusetts Estuaries Project (MEP) is a collaborative effort between the MADEP, the School of Marine Science and Technology at the University of Massachusetts, Dartmouth (SMAST) and interested parties to assess the quality of 89 estuaries (Table A-1) in southeastern Massachusetts and to recommend measures to be taken to restore those waters that are found to be impaired. While the major focus of the project is on embayments impaired by nutrient loadings, those waters affected by bacterial contamination will also be considered. Assessments and management recommendations are to be based on sound water quality data and valid scientific and technical methodologies.

The overall goals of the project are to:

- 1) Develop a coastal TMDL workgroup for coordination and rapid transfer of results,
- 2) Determine the nutrient sensitivity of each of the 89 embayments in southeastern Massachusetts,
- 3) Provide data collection and analysis required for quantitative modeling,
- 4) Conduct quantitative TMDL analysis, outreach and planning, and
- 5) Maintain the integrity of each embayment model to address future regulatory needs.

While the entire project is scheduled for completion in four phases over the course of six years, one initial phase involves the development of a prioritization procedure for selecting the embayments to evaluate further. All data and information will be assembled for each embayment and reviewed for adequacy and completeness. Data collection to fill information gaps will be planned and assessments will be completed to determine which embayments are actually impaired and in need of TMDLs as a step toward their restoration. To this end a standard methodology is being developed for assessing the embayments and, over the course of the project, assessments of the individual embayments will be completed and submitted to the MADEP. Those found to be impaired will be included with the 303(d) list of impaired waters (i.e., Category 5 of the Integrated List) in future revisions. And, TMDLs and management recommendations will be developed.

Actual assessments of many of the embayments were not yet available for listing consideration at the time of the preparation of the proposed 2002 Integrated List of Waters. However, in September, 2002, immediately before the proposed list was due to the EPA, the Massachusetts Estuaries Project's Embayment Water Quality Assessment Interim Report covering priority embayments 1 – 20 was published. While there was insufficient time to review this report and incorporate assessments into the proposed Integrated List at that time, the MADEP has since reviewed it and will include assessments of most of these embayments in the final 2002 Integrated List. These waters are identified in Table A-1.

Also in September, 2002 the Coalition for Buzzards Bay submitted to the MADEP a written request to add 26 embayments and coastal streams to the 2002 303(d) List. The Coalition had completed independent assessments of these waters using data collected by the Buzzards Bay Water Quality Monitoring Program ("Baywatchers"). A preliminary review of the Coalition's submittal revealed that most of the waters they proposed for 303(d)-listing were already included with the 89 waterbodies under consideration by the MEP and thus would be considered for listing sometime in the future. Nonetheless, the Coalition for Buzzards Bay, in a formal comment on the proposed Massachusetts Year 2002 Integrated List of Waters, expressed their view that adequate data and information already existed to support the 303(d)-listing of the 26 embayments in question.

In response to the Coalition's comment, the MADEP reviewed the September 2002 recommendation and associated data for including the embayments in Category 5 as impaired by

nutrients. The MADEP found that the submittal did not meet its criteria for using data and information from external sources, but agreed to provide clearer guidelines for data submittal and requested further clarification on several issues pertaining to the Coalition's data. In addition, Dr. Brian Howes of the SMAST Coastal Systems Group who is managing the MEP offered to assist the Coalition with reviewing and interpreting available data in an effort to determine whether enough data and information existed to make assessments of the embayments in question. After reaching consensus with the Coalition, SMAST prepared a Technical Memorandum for submittal to the MADEP, dated March 31, 2003, that concluded that "of the 26 embayments put forward for 303(d) listing by the Coalition for Buzzards Bay, 11 appear to be nutrient impaired and should be considered by DEP for 303(d) listing. At present, it is not possible to differentiate the cause of the nutrient enrichment (natural/anthropogenic) or the sources or management solutions. Additional data collection and synthesis by the MEP will be required to address these issues." Following a thorough review of the original Coalition submittal as well as the SMAST Technical Memorandum, the MADEP is including ten of the eleven recommended waters in Category 5 of the Final Integrated List based on the substantial loss of eelgrass as an indicator of aquatic life use impairment resulting from nutrient over-enrichment. These waters are identified as such in Table A-1.

Table A-1. Estuaries to be Covered by the Massachusetts Estuaries Project (MEP).

This table presents the 89 embayments that will be considered by the MEP for assessment and TMDL development if necessary. Waters that will appear wholly or in part as impaired by nutrients in Category 5 of the Final Massachusetts Year 2002 Integrated List of Waters based on the review of either the MEP Embayment Water Quality Interim Report (Priority Embayments 1-20) or the Buzzards Bay Coalition submittal are in bold italics (see text for explanation).
